

## **Whats So Bad About Coffee?...**

*This excerpt came with permission for Gastragirl to reprint from Homeyra Bakhshnya, Health Coach*

1. Caffeine is an alkaloid that the coffee plant uses to kill bugs, which eat its seeds.

The coffee plant also uses caffeine in the coffee pods to kill surrounding plants, so the coffee plant can attain more sunlight and grow larger. Caffeine is a pesticide, which causes genetic termination in living cells that come into contact with it.

2. MRI images taken before and after 1 cup of coffee showed a decrease in blood flow to the brain by 45%. When the blood flow reduction was measured exactly, it was actually 52% less blood flow to the brain, after just one small cup of coffee.

3. Brain imaging studies of chronic coffee drinkers showed they presented the same degradation of their brains as chronic alcoholics, cigarette smokers, Parkinson's patients and marijuana users.

4. Coffee can cause an urge to move ones bowels because this is one way the body tries to eliminate poison from the system. The sudden urge to "poo" after drinking coffee is one of the body's defense mechanisms to poison.

5. Coffee increases energy via the human fight or flight metabolic response, because the body is afraid of the caffeine based poison. Coffee doesn't give energy, it removes it from the body.

The energy a person feels when they drink coffee is the body going into overdrive because caffeine is a poison and all poisons activate an energy release in the body (fight or flight).

Coffee removes energy from the system, leaving the person progressively more and more exhausted each day that passes, therefore setting up the world's most dangerous energy stimulation addiction... coffee dependence for energy.

6. When the fight or flight response is triggered in the body, the lower IQ centers of the brain are activated as well as hormonal systems in control of aggression, violence, irrational and illogical decision making, jealousy, rage, anger, fear and paranoia.

Coffee generates lower end mental functioning with a side of every negative emotional response the body can generate.

7. When measured, 1 coffee activated the fight and flight response for 3 consecutive weeks, even though no other caffeine was consumed after that 1 cup of coffee. One cup of coffee poisons the body for 3 consecutive weeks, on a decreasing scale.

8. When coffee (caffeine) is consumed, the limbic part of the brain is hyper activated and the higher learning centers of the mind inhibited. The limbic part of the brain is only concerned with sex, reproduction, protection of territory, food acquisition and personal safety.

The limbic portion of the brain is the most primitive and least developed portion of the mind complex. When you want to out smart or dominate another person, it's best that their limbic system is activated, because it brings them to a mental state equal to that of a child.

9. The birth control pill inhibits clearing of ingested caffeine. This effect is increased dramatically by alcohol or pain killer use, therefore causing many cases of caffeine poisoning, which get treated as other things once the person reaches the hospital.

10. Coffee is proven to cause an enlarged prostate, high anxiety, insomnia, depression, birth defects, pain syndromes, unnatural breathing patterns, brain damage, hyperactivity, learning disorders (from the brain damage) behavior disorders, fatigue, certain types of cancer, Crohns, IBS, colitis, carpel tunnel, ulcers, low iron, heart disease, headaches, PMS, increased incidence of muscle and tendon injury, joint pain, heart attack, stroke, TIA's (mini strokes)... and that's a short list.

11. Coffee causes fat gain and cellulite because by triggering the body's flight or fight system (which any poison or threat does). This eventually changes the body's primary fuel source requirement to one of fat.

When the body is threatened, it prefers fat as its' primary fuel source, over sugar or protein.

Constant activation of the body's fight or flight system (via the daily ingestion of caffeine poison) aids in a metabolic shift to fat storage and fat conservation, because again the body prefers fat as a fuel source when fighting any toxic intruder... because fat contains 9 calories per gram for the fight, as opposed to 4 calories per gram housed by sugar and protein.

Welcome to the land of coffee (caffeine) induced fat gain, weight gain and cellulite. Coffee also destroys muscle, as the body purposely flushes muscle, when it's poisoned, to facilitate additional fat storage.

12. Coffee (caffeine) blocks iron absorption, causing the vast majority of anemia today. The entire threat of caffeine in general includes caffeine teas, chocolates, caffeine based energy drinks, caffeine based pre work out drinks and over 2000 over the counter and prescription medications that PURPOSELY include caffeine.

13. An investigation conducted by the author of the most extensive book on coffee ever written, reviewed almost every scientific research piece regarding coffee and his conclusion was that there's absolutely no scientific evidence what so ever that coffee provides any health benefits to the human body, on any level, in anyway.

He openly declares that any positive promotion of coffee consumption is a blatant lie, doing grave harm to our entire society. The publication of any positive effects of coffee are false and all can be traced back to a very powerful, covert and secret "coffee lobby", which has both commercial and ruling family origins.
